

Phase 2 Feature Additions & Architectural Modifications

This document details all structural modifications, new feature additions, layout redesigns, and architectural changes implemented in the 777 Inventory & Distribution System that fall outside the initial deployment scope outlined in the original Service Level Agreement (SLA).

1. Brand Management Architecture (New Module)

- **Global Brand Tracking:** Added a completely new structural layer linking every single item/SKU to specific "Brands" (e.g., HOME TEXTILES, ZUMBA SUM).
- **Brand Filtering:** Implemented advanced filtering by Brand across the Global Import Utility, Sales modals, and Reports pages.
- **UI Redesign:** Modified dropdowns and interfaces across the system to display the (Brand Name) directly next to items, preventing staff from selecting incorrect SKUs.

2. Post-Transaction Reconciliation Engine (New Feature)

- **Transfer Reconciliation:** Engineered an entirely new interface (Reconcile Transfer Stocks modal) allowing administrators to retrospectively fix mistakes in past transfers, autonomously calculating delta values.
- **Sales Reconciliation & Editing:** Built an Edit Sale system allowing authorized users to go back to previous days and dynamically adjust the quantity or selling price of already-completed sales.

3. Intelligent Item Swapping & Deletion (Architectural Change)

- **Sale Deletion Engine:** Added the ability to completely delete a past sale record. This triggers a complex backend process that automatically refunds the exact quantity back into the specific shop's active inventory and accurately deducts the profit from the total.
- **Brand/Item Swapping:** Added the ability to swap an incorrectly recorded item for a different item in past records. The system autonomously handles restocking the old item, deducting the new item, and recalculating the exact net profit based on the new item's specific unit cost.

4. Historical Multi-Currency Exchange Rates (New Feature)

- **Date-Specific ZMW Rates:** The original system assumed standard real-time POS processing. A custom architectural feature was built that allows users to input a specific ZMW to USD exchange rate *tied directly to the specific historical date of the sale*.
- **Profit Consistency:** This ensures that if a past sale is recorded, the net profit and total sales values are calculated using that exact day's localized currency value, rather than fluctuating based on today's current rate.

5. Advanced Data Interception & Deduplication (Architectural Change)

- **Ghost Transaction Filter:** Rewrote the global database fetching logic (`store/index.ts`) to actively intercept data as it loads from Firebase. The system automatically detects and hides duplicate "ghost"

transfer logs.

- **Integrity Protection:** This ensures Stock Reports remain mathematically perfect, natively mitigating conflicting manual data edits without requiring raw database intervention.

6. Dynamic Date-Locking for Reports (Layout & Logic Redesign)

- **Optimized Export Logic:** Completely redesigned how the Reports Archive interacts with the PDF/Excel extractors.
- **Contextual Accuracy:** Dates now default to "Today," preventing the system from indiscriminately exporting the entire database history by default, and ensuring PDF/Excel headers accurately reflect the exact user-requested date range.
